

Doctrine 2

Juozas Kaziukėnas

www.juokaz.com / juozas@juokaz.com / [@juokaz](https://twitter.com/juokaz)

doctrine

Who am I?

- ▶ Juozas Kaziukėnas, Lithuanian
- ▶ You can call me *Joe*
- ▶ 2 years in Edinburgh, UK
- ▶ Studying in University of Edinburgh
- ▶ Software developer, consultant and evangelist
- ▶ Open source developer for Zend Framework, **Doctrine...**
- ▶ More info in www.juokaz.com and twitter @juokaz

Who are you?

- ▶ Doctrine users?
- ▶ Propel users? (you will be converted!)
- ▶ Interested in DB's and PHP?
- ▶ Interested in PHP news?

doctrine

Doctrine is ORM tool for PHP

Inspired by Hibernate, ActiveRecord etc.

Doctrine 1.X

Doctrine 1.X

- ▶ Slow
- ▶ High memory usage (cyclic references)
- ▶ Magic! (eg. Behaviors)
- ▶ Hard to execute raw SQL
- ▶ Still the best ORM for PHP available today

ActiveRecord

Root of all problems!

ActiveRecord

```
$user = new Model_User();  
$user->name = 'Juozas';  
  
$user->save();
```

Still the best ORM for PHP available today

- ▶ Stable
- ▶ Works
- ▶ Makes development fast, clean and consistent
- ▶ Used in production

Doctrine 2

Doctrine 2 is completely
different

Everything you can do
in Doctrine 1 you can
do in Doctrine 2, just in
a different way.

What's new?

- ▶ Rewritten from scratch (almost)
- ▶ PHP 5.3
- ▶ Decoupled components
- ▶ Simplified API
 - “Complexified” internals?..
- ▶ Performance
 - New hydration
 - Less magic
 - Overall cleanup

Doctrine 2 Architecture:

Based on JSR-317 a.k.a. JPA v2.0

[Common, DBAL, ORM, ODM]

Common

- ▶ Caching
- ▶ Events
- ▶ Annotations
- ▶ Class loaders
- ▶ ... more

Annotations

```
/**  
 * @Foo (bar="foo")  
 * @Bar (foo="bar")  
 */  
class Model_User  
{  
}
```

DBAL

- ▶ Can be used without ORM
- ▶ Abstraction for MySQL, PostgreSQL, Oracle, Microsoft SQL, DB2 etc.
- ▶ PHP types mapping to DB types
- ▶ Extendable
- ▶ ... more

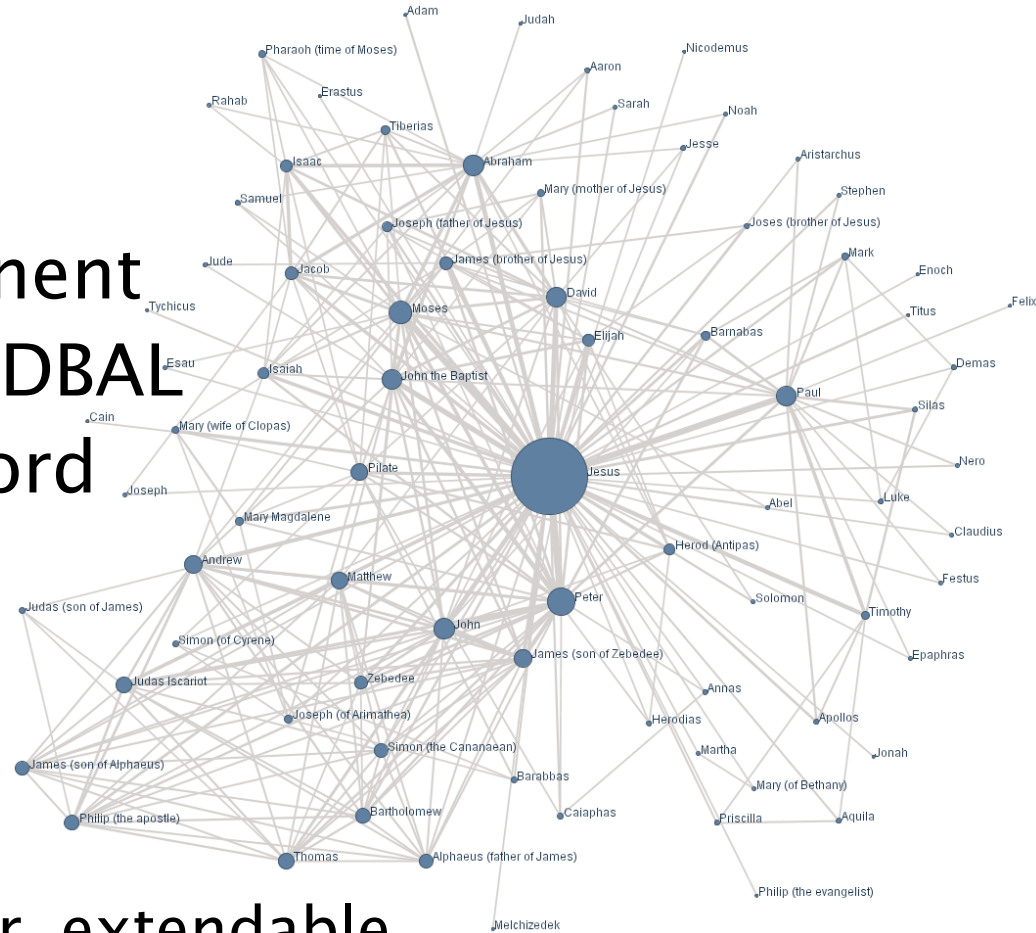

Connection

```
$config = new \Doctrine\DBAL\Configuration();  
//..  
$connectionParams = array(  
    'dbname' => 'database',  
    'user' => 'user',  
    'password' => 'password',  
    'host' => 'localhost',  
    'driver' => 'pdo_mysql',  
);  
$conn = DriverManager::getConnection($connectionParams);
```

ORM

- ▶ Actual ORM component
- ▶ Uses Common and DBAL
- ▶ No more ActiveRecord
- ▶ Entities
 - Metadata mapping
- ▶ Entity manager
- ▶ Query language
 - Faster, cleaner, clever, extendable
 - No forcing

Entity

```
/** @Entity */  
class Model_User  
{  
    /** @Id @Column(type="integer") */  
    private $id;  
    /** @Column(length=50) */  
    private $name;  
}
```

EntityManager

```
$user = new Model_User;  
$user->setName('Juozas');  
  
$em = EntityManager::create($connectionOptions, $config);  
  
$em->persist($user);  
$em->flush();
```

Querying

```
$em = EntityManager::create($connectionOptions, $config);  
  
$query = $em->createQuery('SELECT u FROM Model_User u');  
$users = $query->getResult(); // array of Model_User objects
```

ODM? Hell yeah NoSQL!!!

MongoDB, CouchDB

ODM

- ▶ Abstracts NoSQL databases
- ▶ Similar Metadata configuration
- ▶ A lot of functionality from ORM also available in ODM
 - Querying
 - EntityManager -> DocumentManager

mongoDB

ODM Querying

```
$dm = DocumentManager::create(new Mongo(), $config);  
  
$query = $dm->query('find all Documents\User');  
$users = $query->execute();
```

Much more!

Migration

- ▶ Migrating from Doctrine 1 to Doctrine 2
- ▶ Can be tricky
- ▶ Migrating:
 - ... models is easy
 - ... application code can require some major refactoring
- ▶ Do it only if it's worth it

Finishing

- ▶ Doctrine 2 will be released soon
- ▶ Most of the functionality is there
- ▶ **Used in production**
- ▶ “The library” for PHP 5.3
- ▶ Symfony, Zend Framework etc.

Yay!

Questions?

Thanks!!!
